

# DFX Series

## Liquid Ultrasonic Flow Meters

The DFX series of ultrasonic flow meters has been designed for high accuracy volume measurement of crude oils and other liquid hydrocarbons.

The M&T ultrasonic flow meter is based on the principle of transit-time difference measurement. A pair of ultrasonic transducers, one located upstream and the other downstream, send pulsed waves in the liquid and an electronic converter measures the difference in transit time between the wave travelling upstream to downstream and the one travelling downstream to upstream. This difference provides an accurate measurement of the average velocity of the liquid along the ultrasonic path.

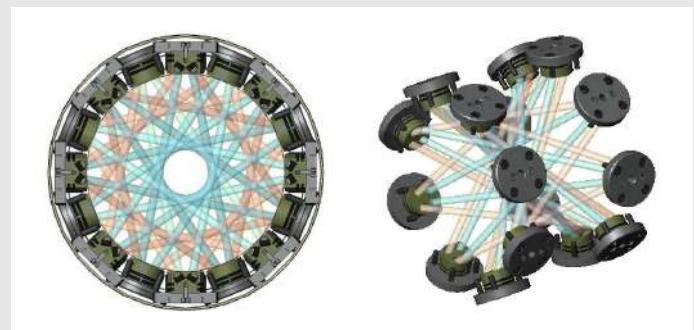

All DFX meters are calibrated at world-class accredited laboratories such as Trapil (France), using hydrocarbons of similar viscosity to site conditions. Flow profiles can be compared between laboratory and field conditions for a unique condition based monitoring.

DFX meters are directly proved against ball or compact provers on a wide range of Reynolds numbers (laminar, transition and turbulent flows). They are approved for fiscal metering and custody transfer in many countries. In addition, they comply with the relevant internationally recognised standards such as API, OIML and GOST.

## Design

The DFX-MM meter consists of two rings of 8 transducers, one located upstream and the other downstream. Each transducer of one ring produces 4 ultrasonic beams and communicates with 4 transducers of the other ring, so creating a three dimensional structure made of 32 ultrasonic paths.

The DFX-LV meter, is equipped with 15 paths and is dedicated to metering low viscosity products.

Thanks to the large number of ultrasonic beams, the DFX new generation of ultrasonic flow meters gives rich and reliable access to quantitative, traceable and accurate information on the velocity profile inside the metering section.

- 15 or 32 beam patented design transit time operating principle
- Unique axial symmetry which is much less sensitive to flow profile disturbances than chordal beam designs
- Small volume transducer cavities minimise scaling effects and avoid gas pockets

## Installation

- Reduced straight runs installation possible
- Compact integrated electronics for easy site commissioning and start-up

## Performance

- A master meter class ultrasonic flow meter exceeding current standards from naphtas/condensates/liquid gases to heavy crudes/fuel oils
- Superior linearity and repeatability thanks to unequalled spatial coverage and ultrafast scanning rate
- Compliant with OIML R117-1 class 0.3, M.I.D. 2004/22/EC and API MPMS Ch5.8
- Truly provable with standard turbine prover loops

## Applications

- FSO & FPSO custody transfer (crude oil, condensates)
- On & offshore allocation metering (crude oil, condensates)
- Pipeline metering stations (crude oil, refined products)
- Tanker loading/unloading terminals (crude oil, refined products, petrochemicals)
- Storage management (crude oil, refined products, petrochemicals)
- 15 beams for refined products/light oils
- 32 beams for multi-viscosity/medium to high viscosity oils

## Communication

- Ethernet communication
- Compatible with all types of flow computer using Modbus TCP
- Condition based monitoring (CBM) software
- Configuration utility with full security and audit trail
- Powerful flow imaging capability

## Service

- Transducers are exchangeable without the need to recalibrate the meter
- No zeroing adjustment needed in case of transducer replacement
- Thanks to their many redundant ultrasonic paths, DFX meters maintain fiscal accuracy in the unlikely event of a transducer failure. Replacement operation can be delayed and planned. This is a quick operation which reduces shutdown time

## Benefits

- Extremely high accuracy (better than 0.1%)
- 32 beam design provides the best redundancy
- Smallest prover volume requirement to achieve fiscal type repeatability
- Compatible with compact and ball provers
- Works with water cut from 0 to 100%
- Successfully tested with GVF up to 20%
- Much lower pressure drop on heavy oil
- Calibration on products by 3rd party at the best laboratories (example: Trapil lab uncertainty 0.043%)
- Can be used without a flow conditioner
- Calibration performance monitoring unique feature
- Condition based monitoring (CBM) available (smart diagnostics)

## International Approvals

M&T's ultrasonic flow meters have received approvals for fiscal metering and custody transfer in many countries. In addition, they comply with the relevant International standards, such as API, OIML and GOST.

## Calibration Uncertainty

All DFX meters are calibrated at accredited laboratories such as Trapil (France), using hydrocarbons of similar viscosity to site conditions.

No master meters: direct proving against ball provers for best calibration laboratory uncertainty: 0.043%.

Typically, the meters are calibrated on 6 flowrates over 5 runs each to achieve a K-Factor uncertainty of +/-0.027% at 95% confidence level as per API MPMS 4.8 table A-1.

## Proving Volume

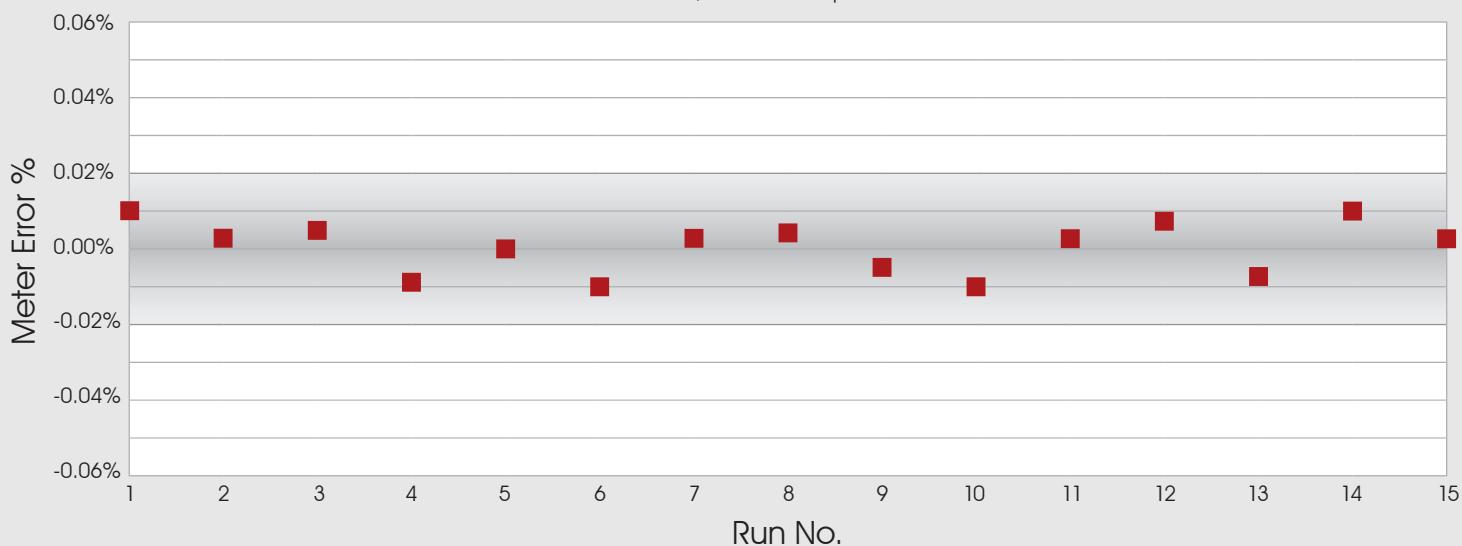

M&T DFX ultrasonic flow meters require much smaller prover volumes than other USMs and are therefore truly provable with standard turbine prover loops where other USMs have to be proved by master meter method. Based on the following results, we are able to provide smaller prover volumes.

## Repeatability

M&T DFX ultrasonic flow meters are provable with standard ball provers thanks to repeatability improved by their unequalled spatial coverage and ultrafast scanning rate.

DFX-MM 08 Repeatability Test

Diesel oil 4.9 cSt - 600m<sup>3</sup>/h - 10m<sup>3</sup> ball prover - 15 runs

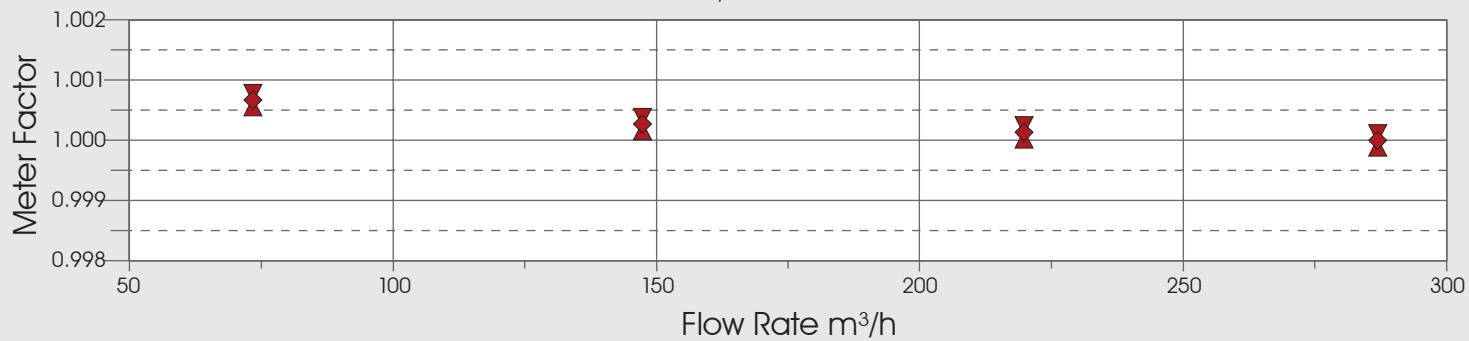

## Heavy Oil

DFX-MM meters accurately measure viscous flows and therefore are ideal when pressure drop is a concern.

DFX-MM 06 Heavy Oil

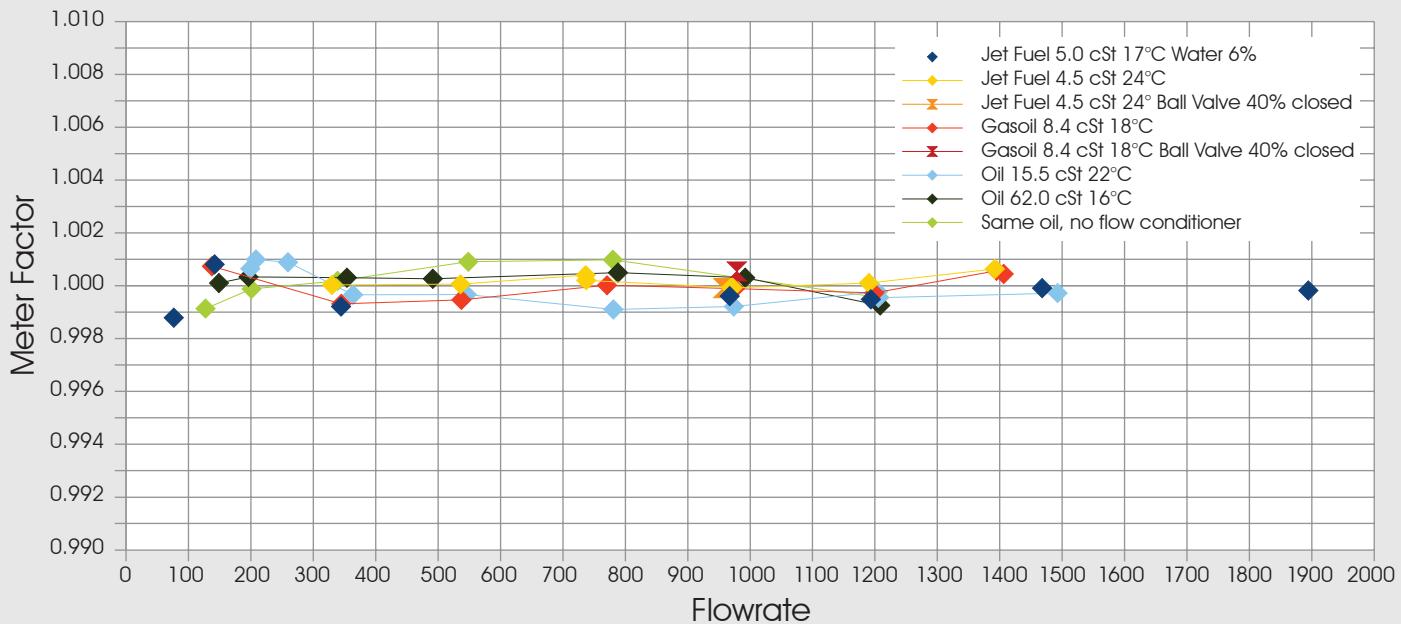

300 cSt mineral oil, 6" PD master meter

## Calibration Curves

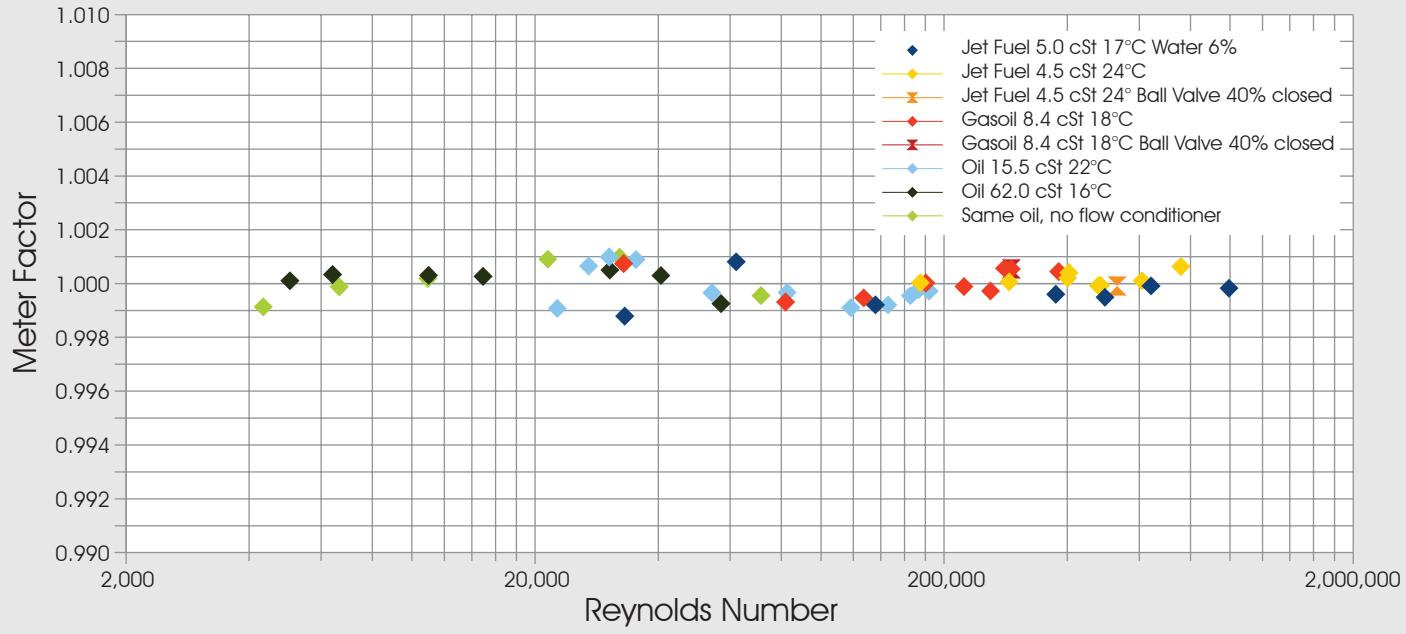

### DFX-MM 08" baselines

7D upstream flow straightener and a 10m<sup>3</sup> ball prover

### DFX-MM 08" baselines vs Reynolds Number

7D upstream flow straightener and a 10m<sup>3</sup> ball prover

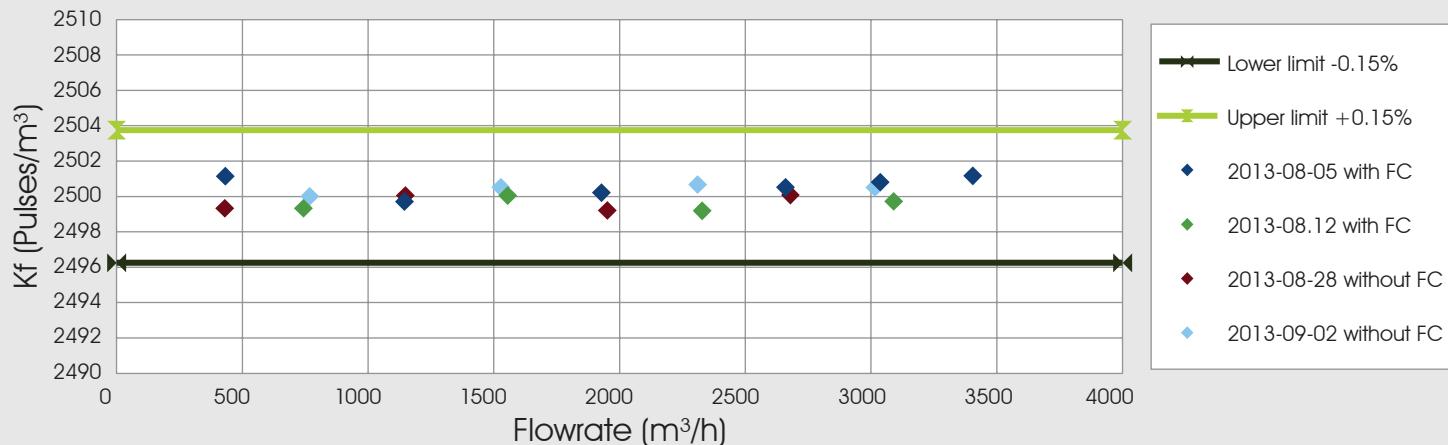

DFX sustains a premium +/- 0.10% accuracy with a constant K-factor over a wide range of viscosities and operating conditions

## Proving Superior Performance

### Customer comparison of DFX installed with and without flow conditioner

DFX-MM 16" prove results on medium oil (15 cSt) with end user ball prover, K-factor deviation

## Condition Based Monitoring (CBM)

Condition based monitoring (CBM) is the process of monitoring parameters in a system in order to identify a change which is indicative of a developing fault condition.

This then allows condition based maintenance to be used rather than conventional time based maintenance.

The M&T CBM system records all major parameters for all 32 beams several times a second into a fully searchable SQL database. This database can be located on any computer connected to the meter via a standard ethernet connection and runs as either an application or a service. For the greatest security it is recommended that it is run as a service on a secure server forming part of the flow computer system.

The CBM application accesses this database continually and is therefore running very nearly in "real time". By using a database very fast access can be obtained to the complete operating history of the meter and trending can either be applied continuously or "as required". The database is accessed normally from the CBM application, but can also be accessed at any time using standard SQL searches from within Microsoft® Excel.

Condition based monitoring (CBM) live data screens showing the status of each of the 32 beams in "real time".
